PERSONAL PORTFOLIO WEBSITE

HTML & CSS Internship Project Report

Prepared by: Shahid U
Technologies: HTML5 and CSS3
Project type: Beginner-friendly internship project

1. Introduction

A personal portfolio website is a website that introduces a student, presents their education and skills, displays project work, and provides contact information. This project creates a clean and responsive portfolio using HTML5 for the content structure and CSS3 for the design. It follows the HTML & CSS Internship Project Guide supplied for this assignment.

2. Objectives

- To build a webpage using valid HTML5 structure and semantic elements.
- To use CSS for colours, typography, spacing, and visual hierarchy.
- To create navigation links that jump to page sections.
- To arrange content using CSS Grid and Flexbox.
- To make the website usable on desktop, tablet, and mobile screens.
- To organise source files and test the completed website.

3. Tools and Technologies

HTML5: structures the page and its sections. CSS3: styles the page, cards, navigation, buttons, and responsive layouts. Visual Studio Code or another text editor can be used to edit the files, and Chrome or Microsoft Edge can be used to test the site.

4. System Requirements

Hardware: a computer or laptop capable of running a modern browser. Software: a text editor and a modern web browser. Internet access is not required to open the basic local website, unless optional external links are used.

5. Website Modules

Header and Navigation

Contains the portfolio logo and links to Home, About, Skills, Projects, and Contact.

Home / Hero

Introduces the student, states a career goal, and provides buttons to Projects and Contact.

About Me

Presents a short biography, education, interests, and current learning focus.

Skills

Displays more than five skills in separate cards.

Projects

Shows two project cards with descriptions and technologies used.

Contact

Displays an contact no , email link and GitHub profile link..

Footer

Displays a copyright line and a link back to the top.

6. Design and Implementation

The page uses a dark background with blue and mint accents. Reusable CSS variables keep the colours consistent. Cards use borders and rounded corners. Flexbox and CSS Grid align content. Hover and keyboard-focus styles provide interaction feedback. Media queries adjust the navigation, columns, cards, and spacing for smaller screens. The project uses only HTML and CSS; it does not use JavaScript, React, Bootstrap, a backend, or a database.

7. Folder Structure

Personal_Portfolio_HTML_CSS_Project/
index.html
style.css
Project_Report.pdf
image
screenshots-desktop.png and mobile.png .

8. How to Run the Project

1. Extract the project ZIP file.
2. Keep index.html and style.css in the same project folder.
3. Open index.html in Chrome or Microsoft Edge.
4. Click each navigation link and test the buttons.
5. Resize the browser or use developer tools to test the mobile layout.

9. Testing Plan

Test	Expected result	Status
Navigation links	Each link jumps to the matching section	To be tested
Desktop layout	Content is aligned and readable	To be tested
Mobile layout	Cards and sections fit narrow screens	To be tested

Contact links	Contact , Email and GitHub links open correctly	Update and test
Content review	No sample or inaccurate details remain	To be checked

10. Expected Outcome

The final outcome is a responsive personal portfolio website with the required sections, at least five skill items, two project cards, working section navigation, contact links, and a footer. The site is organised into separate HTML and CSS files and can be opened locally in a modern browser.

11. Limitations

The website is a static front-end project. The contact section provides links but does not submit messages to a server. Project descriptions and contact details are sample content and must be personalised. Screenshots need to be captured after testing on the user's own browser.

12. Conclusion

This project demonstrates the fundamentals of building and styling a webpage with HTML5 and CSS3. It applies semantic structure, responsive layouts, consistent visual design, and basic usability practices. It can be extended later with more project examples and updated personal information while keeping the core internship submission limited to HTML and CSS.

13. Submission Checklist

☐ index.html and style.css are included.

☐ Home, About, Skills, Projects, Contact, and Footer are present.

☐ At least five skills and two project cards are included.

☐ Navigation links and contact links are tested.

☐ Desktop and mobile layouts are checked.

☐ Desktop and mobile screenshots are captured in the screenshots folder.

☐ Project source folder is compressed into a ZIP if accepted by the submission form.

☐ Project description is included with the submission.
